HYDRAULIC EXTENDIBLE STICK

Exclusively from AMI Attachments, this extendible dipper stick thumb is specially designed for backhoes that have an inside extendible stick, giving you the power and versatility of a stick-pivot thumb without compromising added reach. AMI's extendible stick thumb is welded to the end of the sliding arm. The hydraulic cylinder is then braced against a bracket that counteracts pushing force and allows the thumb to grab hold of the load through the entire range of extension. The thumb slides along the outside of the stick and is designed to rotate on the same axis as the bucket pin, ensuring a solid grip throughout bucket rotation. When retracted, it tucks neatly out of the way under the dipper stick, keeping a clear line of sight for the operator.

SPHERICAL BUSHINGS

The hydraulic cylinder's seals stay intact by allowing the thumb to naturally flex when handling awkward material without adding torsional stress to the seals.

CUSHIONING CYLINDER

By restricting the flow of hydraulic oil at the end of the cylinder stroke, AMI thumbs retract smoothly without a hard stop. This reduces the wear and tear on the excavator and prevents machine shake, making it more comfortable for the operator.
